WORKING PAPER

“Financial and Production Integration in the Macroeconomy” (with *Emanuele Brancati*, *Qingqing Cao*, and *Raoul Minetti*)

Abstract: This paper studies how integration between the financial sector and supply chains shapes business cycle transmission. We develop a dynamic model in which banks provide asset-based finance to firms in supply chains. The model highlights two integration margins. Extensive-margin integration—captured by firms' access to banks specialized in different supply chain segments—amplifies banking shocks. By contrast, intensive-margin integration—captured by the diffusion of trade credit factoring and invoice discounting—attenuates banking disruptions. The analysis reveals that the stabilizing effects of integration dominate when firm production linkages are tight. The predictions are consistent with matched bank–firm data from Italy.
